

# Development of Sb-chalcogenide thin film semi-transparent solar cells: focus on absorber layer post-deposition treatments

---

## Summary

---

*This PhD topic is focused on the development of post-deposition treatment strategies for Sb<sub>2</sub>S<sub>3</sub> thin films and fabrication of semi-transparent solar cells. Sb<sub>2</sub>S<sub>3</sub> is an emerging inorganic PV material that have drawn much interest in recent years due to its excellent stability, suitable bandgap ( $E_g = 1.7$  eV) relatively high absorption coefficient (ca.  $10^4$  cm<sup>-1</sup> at 450 nm), earth abundance, environmentally benign characteristics and low-cost. Due to its unique properties Sb<sub>2</sub>S<sub>3</sub> could be applied in semi-transparent, tandem, and indoor solar cells. This research topic foresees tight international collaboration and several research visits at globally leading universities and research centres in the fields of material science e.g., Liverpool University, or Czech Technical University or University of Verona or Helmholtz Centrum Berlin. We offer an opportunity to be part of the COST action CA21148 - Research and International Networking on Emerging Inorganic Chalcogenides for Photovoltaics, RENEW-PV, <https://renewpv.eu/>*

Research field:	Chemical, materials and energy technology
Supervisors:	Prof. Dr. Ilona Oja Acik Dr. Atanas Katerski
Availability:	This position is available.
Offered by:	School of Engineering Department of Materials and Environmental Technology
Application deadline:	Applications are accepted between June 01, 2023 00:00 and June 30, 2023 23:59 (Europe/Zurich)

## Description

---

The Laboratory for Thin Film Energy Materials at TalTech was the first to demonstrate semi-transparent Sb<sub>2</sub>S<sub>3</sub> solar cell fabricated by chemical spray deposition methods. In the current stage of the development, Sb<sub>2</sub>S<sub>3</sub> thin film solar cells by ultrasonic spray pyrolysis show efficiency of 6.0 % under 1sun. The average visible transparency of structure glass/TCO/TiO<sub>2</sub>/Sb<sub>2</sub>S<sub>3</sub>/HTM is 32% fulfilling the semitransparency requirement of solar windows.

The key for further increasing the efficiency of the solar cells relays on optimization of the optoelectronic properties of Sb<sub>2</sub>S<sub>3</sub> absorber layer by post-deposition treatments and optimization of solar cell component layers and interfaces.

This PhD research topic focuses on development of systematic post-deposition strategies for the Sb<sub>2</sub>S<sub>3</sub> thin films, characterization of the post-deposition treatment effect on the Sb<sub>2</sub>S<sub>3</sub> physicochemical properties, fabrication of the solar cells and their characterization. The post-deposition heat treatment approach will be done in a sulfurizing or selenizing atmosphere. It has been demonstrated for chemical bath deposited Sb<sub>2</sub>S<sub>3</sub> coatings, that implementing this type of post-deposition treatment increases the phase purity and decreases the concentration of deep level defects in the bulk of Sb<sub>2</sub>S<sub>3</sub>.

In this PhD thesis, antimony chalcogenide and metal oxide thin films will be fabricated by robust, resource saving, and easily scalable method such as ultrasonic spray pyrolysis. Spray deposition has great potential to become front-line technology for rapid, cost-effective, large-area and high yield mass production of solar cell.

The project will involve synthesis of materials, fabrication of solar cells, and characterization of materials and devices.

## Responsibilities and (foreseen) tasks

- Engineering the device quality properties of Sb<sub>2</sub>S<sub>3</sub> thin films deposited by chemical spray pyrolysis method followed by post-deposition treatments.
- Development and optimization of semi-transparent solar cells and its constituent layers (Sb<sub>2</sub>S<sub>3</sub> absorber layer, electron transport layer, hole transport layer, interface layers) by chemical deposition methods.
- Characterization of materials and solar cell devices using various dedicated characterization techniques.

- Analysis of the research data, preparing reports, presentation at conferences (poster, oral talk), write research articles.
- Contribute to the organization and dissemination of research and practitioner workshops where project findings are presented.

### Applicants should fulfil the following requirements:

The successful applicant will hold a Master degree in Physics, Chemistry, Materials Science or a related field. Previous research experience in thin film technologies and material characterization will be an advantage. Excellent team working attitude and communication skills in English (both written and oral) are an essential requirement. Competences in using data analysis and graphing software: Microsoft Office (Word, Excel and PowerPoint), Origin.

The candidate should submit a research plan for the topic, describing the understanding of the current state of the art of Sb<sub>2</sub>S<sub>3</sub> thin films and solar cells development and propose the research activities for the Sb<sub>2</sub>S<sub>3</sub> post-deposition treatments.

### We offer:

- 4-year PhD position in one of the most internationalized and leading PV research groups in Estonia
- The chance to do high-level research in one of the most booming emerging photovoltaic field.
- Opportunities for conference visits, research stays and networking with globally leading universities and research centers in the fields of material science.
- Opportunity to be part of the COST action CA21148 - Research and International Networking on Emerging Inorganic Chalcogenides for Photovoltaics, RENEW-PV, <https://renewpv.eu/>

### About the research group

The main research topic of the Laboratory for Thin Film Energy Materials is the development of metal oxide and sulphide thin films and nanostructured materials for solar cells, electronics and environmental applications by chemical technologies such as spray pyrolysis, chemical bath deposition and sol-gel. The technologies that are developed in the laboratory are simple, inexpensive, and easily transferrable to industrial scale. A new type of ultra-thin absorber based solar cell design and its component layers were developed in the laboratory and secured by several international patents. Over the last 25 years the main topics in the research group has been development of emerging thin film photovoltaic materials such as CuInS<sub>2</sub>, Sb<sub>2</sub>S<sub>3</sub>, Sb<sub>2</sub>Se<sub>3</sub>, Sb<sub>2</sub>(S,Se)<sub>3</sub> and Sb-Bi alloys, and the fabrication of solar cells based on them. The research group has extensive knowledge on development of CdTe thin film solar cells by close spaced sublimation. The laboratory staff is coordinating or being involved in several international and national research projects and are the grant holders of the COST action project RENEW-PV. RENEW-PV is a joint network of more than 200 researchers and industry partners from more than 30 countries worldwide developing emerging inorganic PV materials and devices.
